REGIONAL CLIMATE STRESSES

SOAR OR SPRAWL

One of the biggest debates in terms of sustainability is the question of building horizontally or vertically, and the effect this has on density of the city. Theoretically, a denser city would be more sustainable, provided the city has the necessary infrastructure to support a large quantity of people living within a certain area. The cities displayed below are the most extreme cases within the sample study in terms of land area, number of tall buildings, built area, and population density.

Smaller number of buildings, smaller land area growth

Smaller number of buildings, larger land area growth

 Mumbai has the highest population density of the twenty cities studied

Larger number of buildings, smaller land area growth

Larger number of buildings, larger land area growth

 New York has the third lowest population density of the twenty cities studied

Education is the often times thought of as the foundation of a strong society. It is associated with improving all aspects of life. Having the proper basis to prepare citizens for the labor force is an important driver towards the welfare of a society and is vital to long-term sustainability. According to the United States department of Health and Human Services, a solid education "shapes the personal development and prospects," of the individual and is essential to the "economic and social progress of a nation (America's Children in Brief: Key National Indicators of Well-Being 2012)." Having the basic skills to read and write, alone gives people a gateway to provide for themselves. Access to quality education and supplementary libraries begins to shape a society by providing the skills needed to boost an economy and inform people on health and other dire issues. With higher educational attainment, citizens can be exposed to more opportunities, which leads to economic growth of a society.

COST OF LIVING

costs of goods and services in US dollars versus average monthly income

The average person works

1,776

hours a year and devotes

62%

of the day, to personal care and leisure

-OECD

A healthy balance between work and family, in terms of quality of life, is another essential aspect to the over-all well-being of a society. According to the OECD, when a good balance between work and family cannot be achieved, the welfare of a country and the opportunity for the country to develop are directly affected (Better Life Index). The cities that tend to thrive often have something to offer the family. The average size of a family varies between cities depending on the amount of time citizens spend working and on a city's cost of living. Without the proper economic security and free-time available, people will choose to have larger or smaller families.

HEALTH

Obesity rate and people living with HIV/AIDS

OBESITY RATES FOR COUNTRIES
(BMI > 30)

In the rankings shown above, **India** came in with the lowest obesity rate and **Egypt** had the highest followed by **UAE**

According to the World Health Organization, overweight and obesity are defined as abnormal or excessive fat accumulation that presents a risk to health. A crude population measure of obesity is the body mass index (BMI), a person's weight (in kilograms) divided by the square of his or her height (in metres). A person with a BMI of 30 or more is generally considered obese. A person with a BMI equal to or more than 25 is considered overweight.

Overweight and obesity are major risk factors for a number of chronic diseases, including diabetes, cardiovascular diseases and cancer. Once considered a problem only in high income countries, overweight and obesity are now dramatically on the rise in low- and middle-income countries, particularly in urban settings.

THE NUMBER OF PHYSICIANS AVAILABLE FOR EVERY 1000 PEOPLE
These are the numbers from the WORLD HEALTH ORGANIZATION on the country level

Globally, 34.0 million [31.4–35.9 million] people were living with HIV at the end of 2011. Sub-Saharan Africa remains most severely affected, with nearly 1 in every 20 adults (4.9%) living with HIV and accounting for 69% of the people living with HIV worldwide.

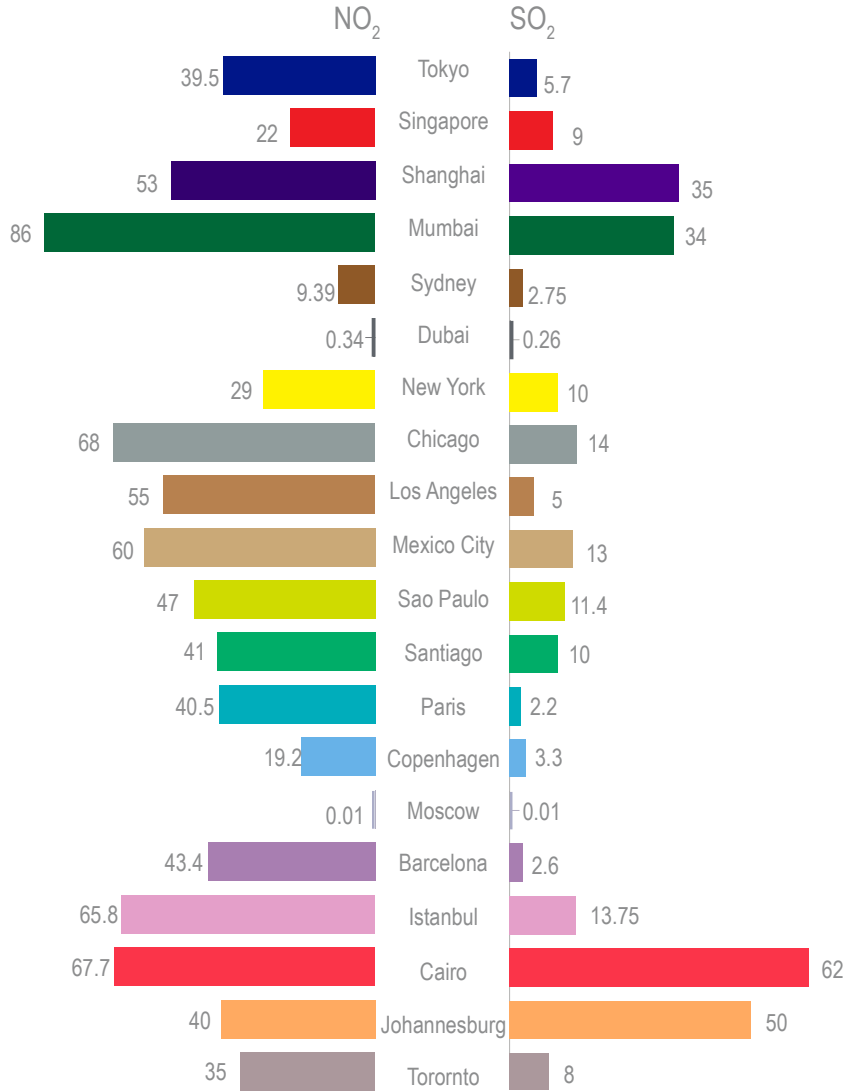

10.94% of the population in **South Africa** has HIV/AIDS. This is almost 10 times more people compared to other countries in the world.

LAND AND GREEN SPACE

Land: Total land area in km² and percentage of green space in city boundaries

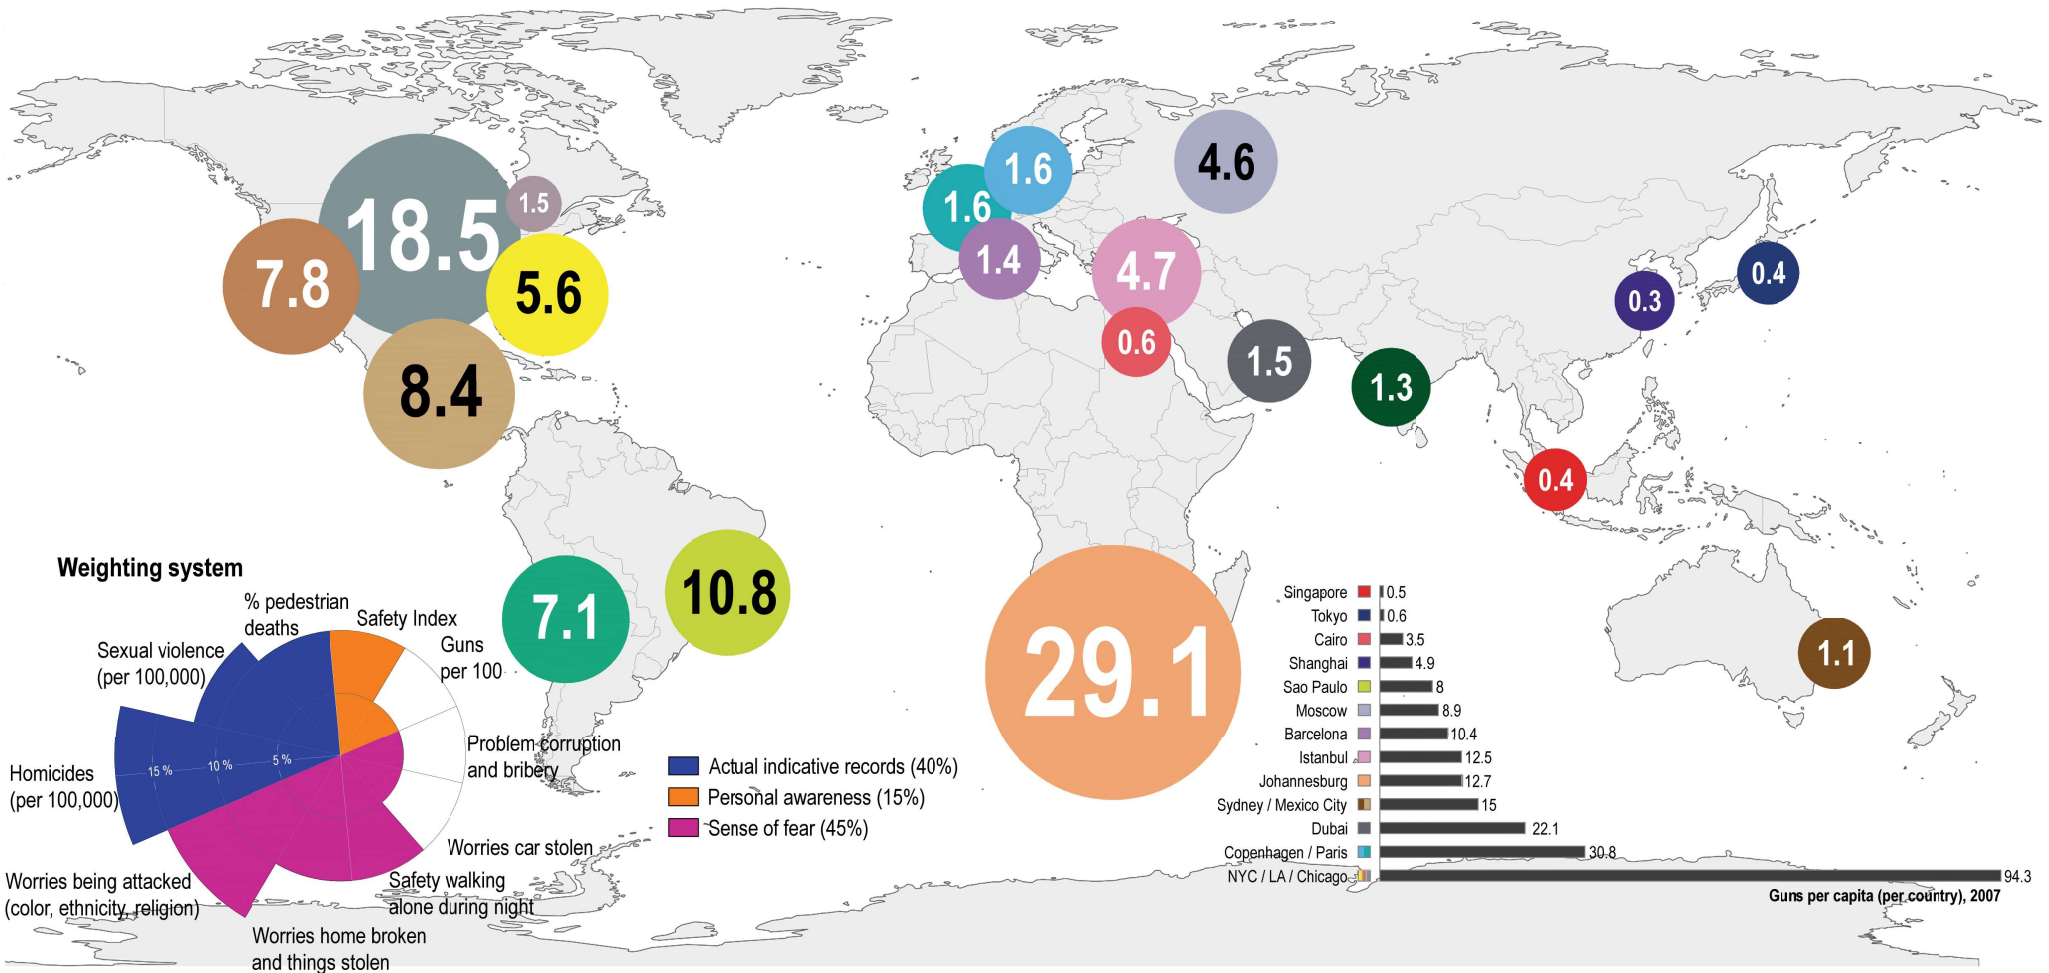

Land area and green space:

The total land area includes all of the land area contained within the political boundary of a city. This is an indicator of the amount of land resource that city has to build upon. Green area includes all park or forest areas, private and public what are located within the political boundaries of the city. Green space is an indicator of the amount of natural areas that have either been untouched by the built environment or modified to imitate the untouched green spaces to give back to the community and environment.

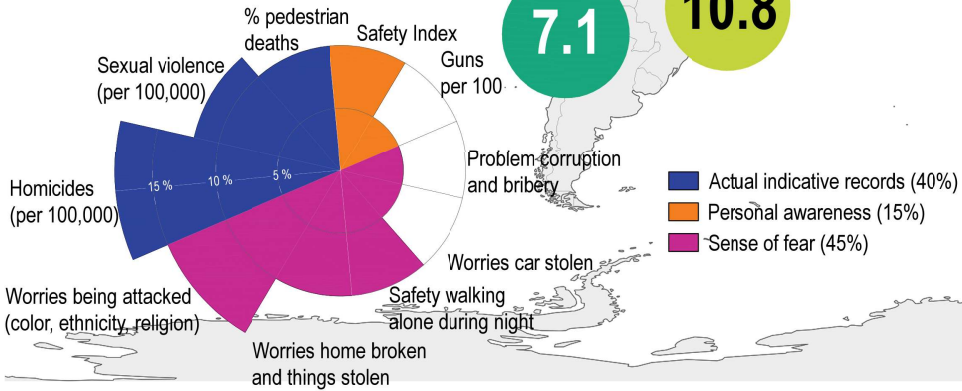

SAFETY

Safety explained graphically paying more attention to homicides per 100,000 (color bubbles), as it's been considered the most relevant indicator within safety, having the biggest impact in the weighting system (18%). This system is also graphically explained below, and additional charts show other important information of every city in terms of safety.

	Top-five safest cities in terms of...					Unsafest
Sexual Violence	0.1	2.6	5.9	6.4	11.7	90.8
Worries being subject to physical attack	6.8	12.2	14.4	15.3	19.2	71.1

GDP AND DEBT

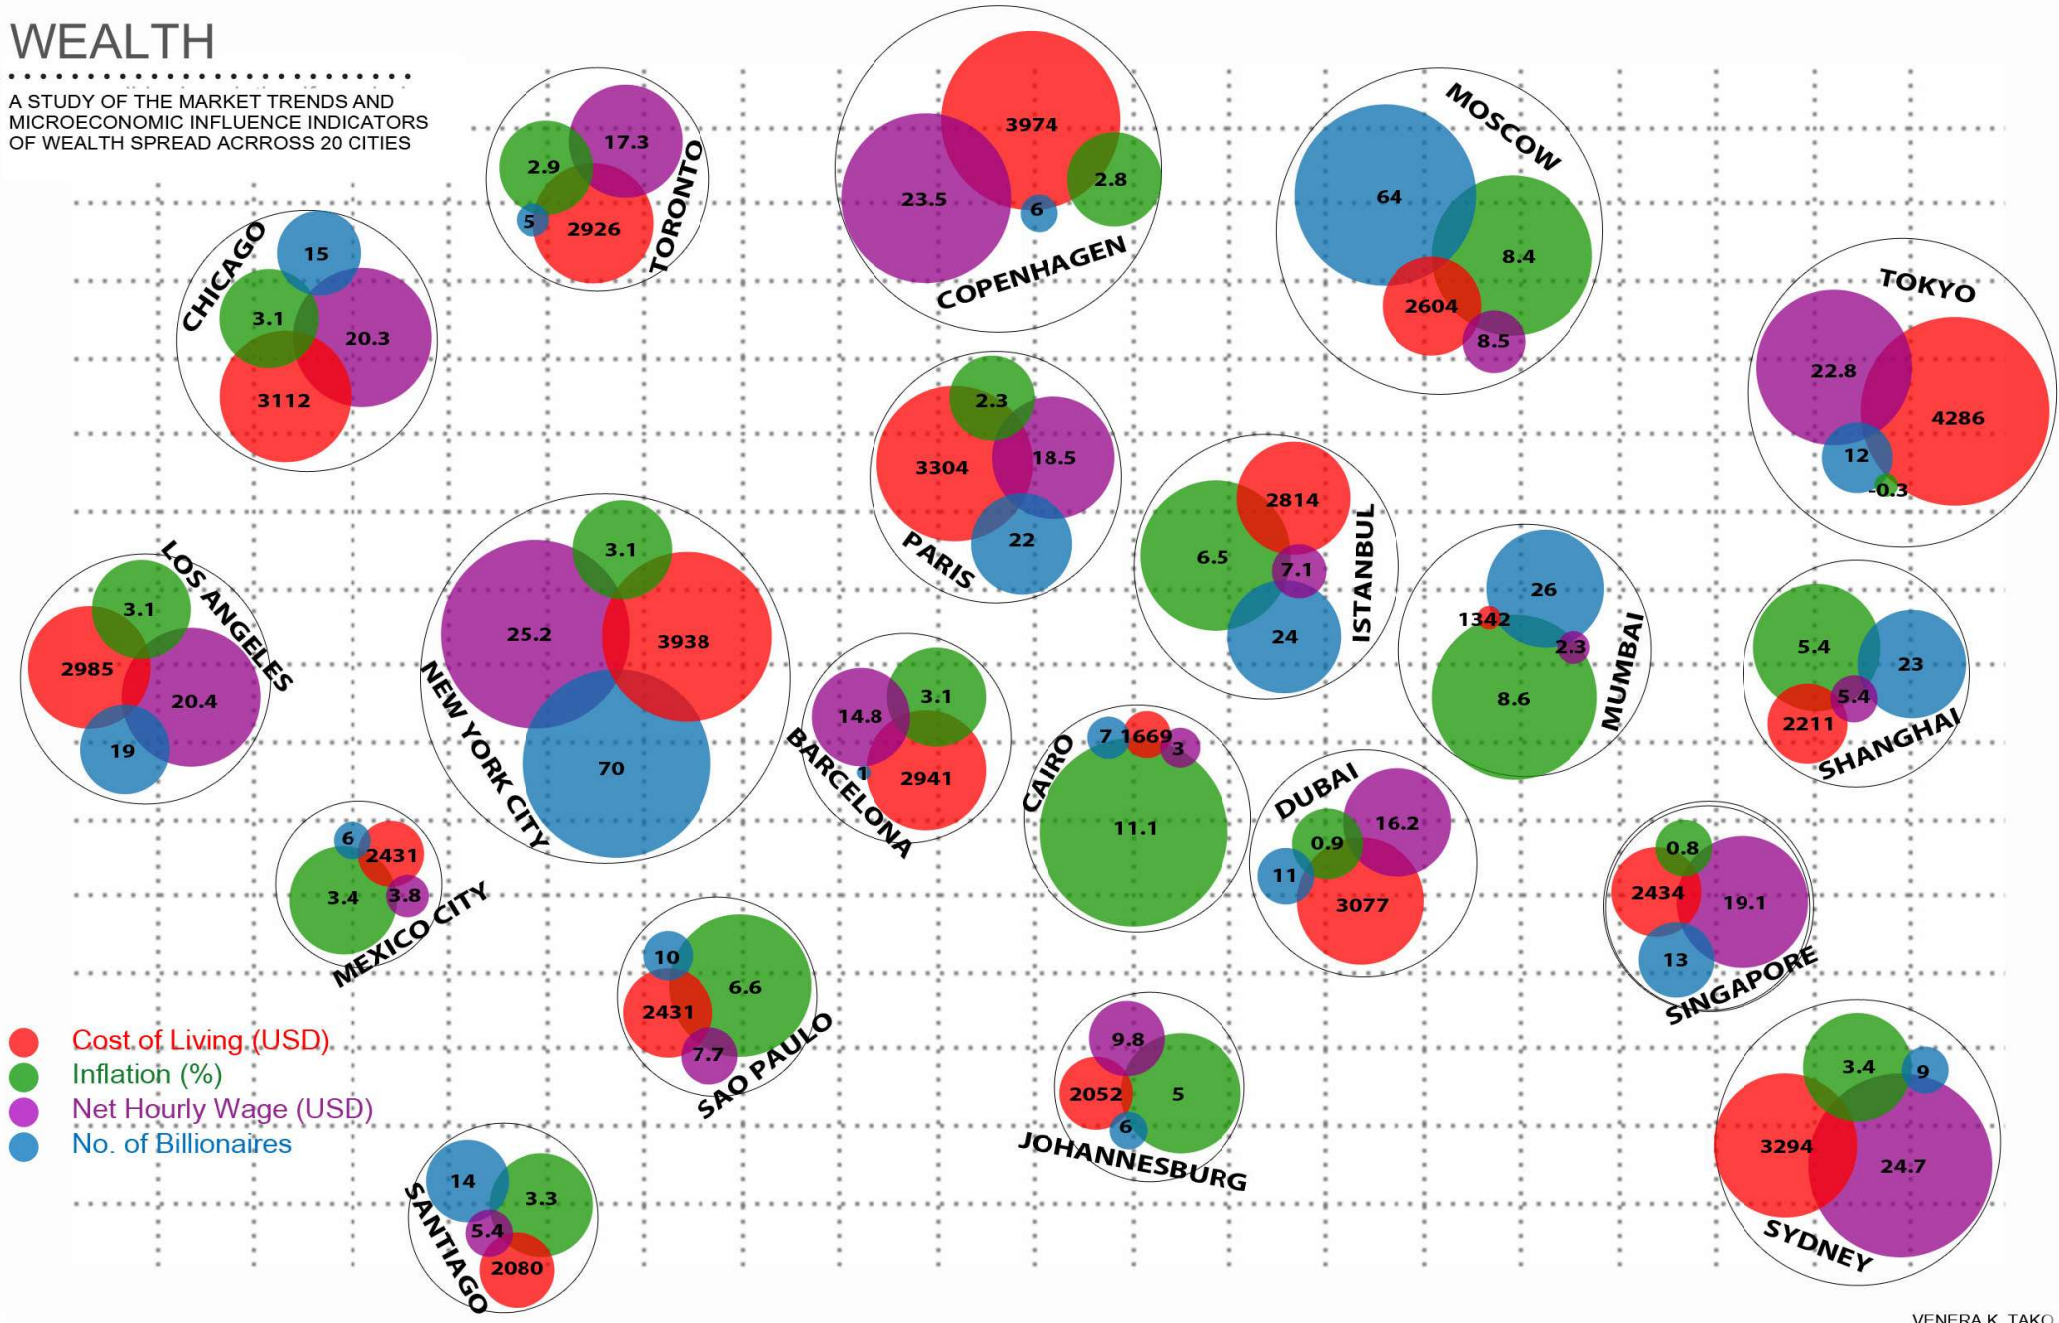

Debts owed by national governments

Public Debt is the cumulative total of borrowings by the National Government from accounts of the country's own currency therefore maintains wealth within the country when repaid.
External Debt is the total of all foreign currency liabilities and must be paid out via foreign exchange earnings.
 In the below diagrams, both indicators are represented relative to each country's Total GDP. Corresponding cities are represented with the city's share of the country's GDP.

WEALTH

A STUDY OF THE MARKET TRENDS AND MICROECONOMIC INFLUENCE INDICATORS OF WEALTH SPREAD ACROSS 20 CITIES

WORKFORCE DEPENDENCY

Proportions of the population supported by the working-age population (16 ~ 64 y.o.)

Cities are represented below in order of lowest to highest **GDP per Capita** in order demonstrate the relationship between wealth and the dependency ratios. A notable observation from this relationship is that in most cases, with greater wealth comes fewer children and a larger elderly population.

Copenhagen stands out as an exception of the GDP per Capita trend largely in part to the significant amount of quality government institutions and support offered to its population.

Japan has the largest total dependency ratio in the world. This has occurred despite a low birth-rate due to a rising life expectancy of the elderly population.
