In the era of the mass-super cities, there are lots of landscapes separately located in the city, but with the development of economic cities such as New York, Shanghai or Hong Kong, the old city center gradually changed its landscape style to accommodate the population growth. The traditional planning system in the city center was centered on a single urban block. The layout of the city gradually changed, and the urban expression of the buildings started to reflect the development of the city. In this project, we aim to explore the idea of urban planning and transformation of the city center. The project focuses on the development of the city center and the transformation of the urban landscape. The design aims to create a mixed-use development that includes commercial, residential, and public spaces. The design also includes a central park that connects the urban areas and provides a green space for the residents. The development is designed to be pedestrian-friendly and includes a network of pedestrian and bicycle pathways. The project also includes a variety of public spaces, including squares, playgrounds, and outdoor seating areas.
